

## **How to install carpet tiles**

- let the carpet tiles acclimatize: put the carpet tiles in the room where you want to install them about 24 hours before the installation; temperature has to be +18°C
- be sure the surface is flat, dry, inflexible; dustfree and greaseproof
- make sure that you have more tiles than you need. It is always possible that you have to cut some tiles to fit perfectly in the corners and the borders.
- look at the arrows at the back of the tiles, put them all in the same direction. This way, the pile is in the same direction and will give a smooth and continuous effect. Some of our tiles have to be installed in checkerboard fashion, the arrows at the back also make that job easier
- use double-sided adhesive tape or a fixation product. If you choose fixation, tiles can be removed easily

You can install carpet tiles yourself. If you do not want to take any risk, it is advisable to hire a professional.
